

Second Iteration Notes

Requirements until 3rd meeting:

Runnable system that has:

- Group leader dashboard — view pending join requests, approve or reject each request
- Approve / Reject Join Request API — PUT /api/groups/:id/requests/:requestId (leader only)
- Auto-lock group when party size is reached (status → closed, further joins blocked)
- In-app notification system — 5 types: join_request, request_approved, request_rejected, group_full, group_cancelled
- Notification Bell — unread badge, dropdown list, mark-all-read, 30-second polling
- Cancel & Modify Reservation API — PATCH / DELETE /api/reservations/:id with ownership check
- Reservation Management UI — customer can cancel or edit their reservations with filters
- Edit Group & Edit Reservation modals — pre-filled forms, live validation
- Enhance Browse Groups page — full date/time display, capacity progress bar, 'I Want to Join' flow, search & filter
- Open/Closed toggle + live capacity preview on Make Reservation / Create Group modal
- One-group-per-slot rule — API blocks duplicate group reservations and individual bookings on taken slots
- Live slot availability in reservation modal — fetch real API on date selection, disable taken slots
- Reservation history page — customer can view past and upcoming reservations
- notifications table auto created on server startup (no manual migration needed)
- 44 passing automated tests maintained across Auth, Slots, and Reservations suites

Overall Requirements:

Title: Group Leader Dashboard

Description: MyGroups page accessible from sidebar. Shows all groups the current user leads. For each group, lists pending join requests with requester username and player count. Leader can approve or reject each request with a single click.

Title: Approve / Reject Join Request API

Description: PUT /api/groups/:id/requests/:requestId — authenticated leader-only endpoint. Accepts { action: 'approve' | 'reject' }. On approval, increments current_count; auto-closes group when party_size is reached. Triggers notifications to the requester.

Title: Auto-Lock Group When Full

Description: When the last join request is approved and current_count reaches party_size, the group status is automatically set to 'closed'. Further join requests are rejected with HTTP 409. A group_full notification is dispatched to all group members.

Title: Notification System API

Description: GET /api/notifications returns last 30 notifications for the current user. PUT /api/notifications/:id/read and PUT /api/notifications/read-all mark notifications as read. Notifications table is auto-created on server startup.

Title: Notification Bell

Description: Bell icon in the top-bar shows an unread badge count. Clicking opens a dropdown listing recent notifications with type icons, title, body, and timestamp. Polling every 30 seconds keeps the count fresh without page reload. 'Mark all read' button clears the badge.

Title: Cancel & Modify Reservation API

Description: DELETE /api/reservations/:id cancels a reservation (ownership required, status → cancelled). PATCH /api/reservations/:id allows updating date, time, or player count with the same conflict-check and validation rules as creation (future date, 10:00–21:00, 3–20 players).

Title: Reservation Management UI Description: Dashboard section listing the user's reservations with status badges (pending, confirmed, cancelled, completed). Filter bar allows narrowing by status. Each row has Edit and Cancel buttons. Cancel triggers a confirmation dialog before calling the API.	Title: Edit Group & Reservation Modals Description: EditGroupModal and EditReservationModal open pre-filled with current values. Inline validation highlights errors. On save, the updated record is reflected immediately in the parent list without a full page refresh.
Title: Enhanced Browse Groups Page Description: Groups list now shows full date and time range, arena name, capacity progress bar (current / party_size), and open/closed status badge. Search by group name and filter by date are supported. 'I Want to Join' flow collects player count before submitting the request.	Title: Open/Closed Toggle + Live Capacity Preview Description: Make Reservation and Create Group modals include an Open/Closed toggle. When 'Open' is selected, a party size input and a live capacity bar appear. The bar updates as the user types, showing how many spots remain before the group auto-closes.
Title: One-Group-Per-Slot Rule Description: API enforces that only one group reservation can exist per arena slot. If a group already exists for the chosen date/time, creating another group or an individual reservation on the same slot returns HTTP 409 with a descriptive error message. Enforced at model layer.	Title: Live Slot Availability in Reservation Modal Description: When the user selects a date in the Make Reservation modal, the frontend fetches GET /api/slots/availability for that date. Slots that are fully booked are disabled in the time dropdown. Available player counts are shown next to each slot label.
